# UR5083 Polyurethane Resin

UR5083 is an ultra-high performance, two-part resin system that has the unique ability to "self-heal" when penetrated. As a result, this resin has found use in several applications in electrical and electronic devices that require; the testing of circuits and devices through the resin itself or the need to pass wires or connections through the resin when in situ. This resin also has the ability to adhere to the case or device while slipping off the test probe, wire or connector on withdrawal; the hole quickly fills and seals to provide a moisture barrier.

- Re-enterable, self-healing gel; ideal for applications requiring the removal of wires and connectors
- High water resistance and low moisture sensitivity during cure; ideal for marine applications
- Excellent electrical properties; ideal for protecting PCBs in harsh environments
- Low penetrating viscosity and long useable life; ideal for potting complex or difficult geometries

Cured System:	Cured Density (g/ml)	0.98
	Temperature Range (°C)	-60 to +100
	Max Temperature Range (Short Term (°C)/30 mins) (Application and Geometry Dependent)	+110
	Shore Hardness @ 25°C	Soft gel
	Colour (Mixed System)	Translucent
	Volume Resistivity (ohm-cm)	10 <sup>9</sup>

### Mixing Procedures

#### **Resin Packs**

When in Resin pack form, the resin and hardener are mixed by removing the clip and moving the contents around inside the pack until thoroughly mixed. To remove the clip, remove both end caps, grip each end of the pack and pull apart gently. By using the removed clip, take special care to push unmixed material from the corners of the pack. Mixing normally takes from three to four minutes depending on the skill of the operator and the size of the pack. Both the resin and hardener are evacuated prior to packing so the system is ready for use immediately after mixing. The corner may be cut from the pack so that it may be used as a simple dispenser. There is also a YouTube video (Polyurethane Mixing Instructions) available on the Electrolube channel to show the mixing process.

#### **Bulk Mixing**

When mixing, care must be taken to avoid the introduction of excessive amounts of air. Automatic mixing equipment is available which will not only mix both the resin and hardener accurately in the correct ratio but do this without introducing air. Containers of Part A (Resin) and Part B (Hardener) should be kept sealed at all times when not in use to prevent the ingress of moisture. Bulk material must be thoroughly mixed before use. Incomplete mixing or use of the wrong mix ratio will result in erratic or partial curing.
